

PREPARATION BOOTCAMP

< WORKING ENVIRONMENT />

PREPARATION BOOTCAMP

Welcome to your very first bootcamp!

You will acquire a lot of unexpected skills (human, technical, organizational, ...) during this magic period. It may be hard sometimes, or even frustrating, but one day, we will laugh about it and be so proud of you!

Usual daily content

Tasks

Tasks are generally independent from each other, with an incremental difficulty. The last exercises are calibrated to be hard enough to be done by a happy few only. However, you should be able to understand and succeed in the simplest "carrot" tasks.

Challenges

The challenges use several notions scattered throughout the subjects' exercises. If you don't feel up to it straight away, that's normal. Come back later to try again.

You should compare your productions with others and discuss the pros and cons of each solution. The best answers could be presented publicly.

Games

Last but not least, in addition to your daily tasks, you are always encouraged to go as far as possible through a specific game, related to the notions of the subject(s).

Work on it as soon as you have a bit of time, or whenever you need a break in your day! Even if you'll learn a lot playing them, you're not supposed to spend all day on the games. You've got better things to do!

GAME

OH MY GIT!

In addition to the tasks below, you must go as far as possible in [this game](#).

Work on it as soon as you have a bit of time, or whenever you need a break in your day!

You can also have a look at [learngitbranching](#).

Working environment

Task 1.1

Connect to the IONIS network and:

- ✓ open ["My" page](#) and check your schedule for this week;
- ✓ open [the Microsoft365 page](#) and check your emails;
- ✓ open [the Python help page](#);
- ✓ open the Microsoft Teams application;
- ✓ browse your local directory in a file manager;
- ✓ type `pwd` into a terminal emulator.

Task 1.2

Watch those 3 dense 100-second videos from the [Fireship Youtube channel](#):

- ✓ [Linux in 100 seconds](#)
- ✓ [Linux Directories Explained in 100 Seconds](#)
- ✓ [Bash in 100 Seconds](#)

You probably did not understand everything covered in these videos...

Discuss with your neighbors the points you understood and the shady ones, and try to collectively shed light on some Linux core concepts.

You may watch an unlimited number of videos to learn how to use Linux or how to code, but nothing is better than your own experience.

Task 1.3

Can you guess why it's important to use at least a terminal text editor?

✓ VSCode

Install Visual Studio Code. Once installed, use it to create a file.

In this file, write "VSCode is a very practical and user-friendly IDE.", save this file somewhere on your computer and exit VSCode.

Do not save your files into a junk folder.

Save them into a specific, well-named and organized folder.

✓ Nano

In your terminal emulator, use the *Nano* editor to create a file.

In this file, write "Nano is a simple text editor in your terminal.", and save this file.

✓ Emacs

In your terminal emulator, use the *Emacs* editor to create a file.

In this file, write "Emacs is an advanced text editor.", and save this file.

✓ Vim

In your terminal emulator, use the *Vim* editor to create a file.

In this file, write "Vim is an advanced text editor.", and save this file.

Challenge

This challenge is pretty easy, it's a typing test focused on code writing.

First, go to 10fastfingers.com and/or monkeytype.com;

Then, aim for the best score in terms of WPM (Words Per Minute) **and** Accuracy.

Do NOT break your keyboard on the very first day.

Git interlude

From this point onwards, all your projects will have to be turned in through a GitHub repository. Github repositories are simply **git repositories** hosted on github.com. So first, create an account on github.com using your Epitech email address.

If you already have a GitHub account, you can simply add your Epitech email address to the list of emails linked to your account.

On GitHub, all your Epitech projects will be grouped in an organization. For this first time, you are already part of a team in this organization, which gives you access to the repository to deliver today's work.

From now on, for every project, you will be given access to a group on the GitHub organization and thus have access to the project's dedicated repository.

Now generate an ssh key named `id_rsa` and add it to your GitHub account. This key will allow you to authenticate with GitHub (and thus access your repositories) via your terminal.

One last thing: be sure to authorize the previously added ssh key for use with single sign-on on [GitHub.com](https://github.com).

For more information, see the document "How to turn-in using Github" on the intranet ([here](#)).

Don't forget to set up your git configuration so GitHub can identify you:

```
git config --global user.name "Firstname Lastname"
git config --global user.email "firstname.lastname@epitech.eu"
```

Do a delivery - Clone a repository and push your work

Now, it is time to check if the previous part really works.
To do so, we are going to clone the repository for today's tasks.

You can check on the organization page of GitHub to see the list of all the repositories you have access to.
From a repository webpage, you can click on the "Code" button to have access to the repository link (to clone it using SSH).

If it worked, you should have a result similar to:

```
git clone git@github.com:EpitechMyPromo-2042/X-ZZZ-666-NCE-7-project-1.git
```

```
Cloning into 'X-ZZZ-666-NCE-7-project-1'...  
warning: You appear to have cloned an empty repository.
```

Now, you have to move all task directories (previously created) into the repository of the day.
Then, you have to inform "git" of your wish to **add** these files.
After that, you have to **commit** a new local revision which contains all these modifications.
Finally, you have to **push** this revision to the remote server.
From now on, commit and push at the end of each task.

Make sure that the file permissions have not been altered during the copy/move.

	u g o								
	754								
	/						\		
access	r	w	x	r	w	x	r	w	x
binary	4	2	1	4	2	1	4	2	1
enabled	1	1	1	1	0	1	1	0	0
result	4	2	1	4	0	1	4	0	0
total	7			5			4		

Have you read the document on the intranet already?

Shell

Task 2.1

The shell is a program running inside a terminal allowing to browse files and directories, as well as running programs using text-based commands.

Find the right commands in order to:

- ✓ go to your recently cloned directory;
- ✓ list the content of this directory;
- ✓ create a `01` directory inside this directory;
- ✓ create a `task2.1` file inside the cloned directory;
- ✓ move this file inside the `01` directory of the cloned directory.

Do NOT use your mouse or touchpad; but only your keyboard!

Task 2.2

In a file named `task2.2`, write a command that lists the current repository's files and directories (without hidden files, ellipses, or files starting with a dot) sorted alphabetically.

Files and directories should be separated by commas. Directories must end with a slash.

Task 2.3

Add execution **permissions** for everyone to your previous file.

Task 2.4

Replicate the folder structure exactly as displayed below. Commit and push.

```
"task2.4"/
|-- "Electro"/
|   |-- "Aphex Twin"/
|   |   |-- "Come to Daddy"/
|   |   |-- "Bucephalus Bouncing Ball"
|   |-- "Fatboy Slim"/
|   |   |-- "You've Come a Long Way, Baby"/
|   |   |-- "1-02 - The Rockafeller Skank"
|-- "HipHop"/
|   |-- "Beastie Boys"/
|   |   |-- "Singles"/
|   |   |-- "Sabotage-Get It Together"/
|   |   |-- "Sabotage (LP Version)"
|   |-- "MF DOOM"/
|   |   |-- "Madvillain - Madvillainy"/
|   |   |-- "03 - Meat Grinder"
|   |-- "Notorious BIG"/
|   |   |-- "Life After Death"/
|   |   |-- "Hypnotize"
|-- "Rock"/
|   |-- "Rage Against The Machine"/
|   |   |-- "Rage Against The Machine"/
|   |   |-- "Killing In The Name Of"
|-- "Soundtracks/"
```

Directories end with a slash.

Check if you did it right using `tree -FQ --charset=ascii .`

Find a way to push an empty directory.

Sociability

Task 3.1

Chat with the 3 closest people to you.
Take this opportunity to help them since you have almost completed your daily tasks already.

Remember to keep the smile :)

By the way, can you cite the fundamental values of Epitech?
Ask your local pedago, (s)he must know them. If not, ask your local director.

Task 3.2

Observe your colleagues around you.
Can you spot someone looking at you? Do you know this person's name?
Go and introduce yourself, you will probably work together sooner or later.
